

Auto Calling CRM Software

Automated Outbound Calling, Incoming IVR, Live Agent Transfer, Recording,
and CRM Management

Business Proposal Document

Prepared for companies that need faster customer calling, smarter lead handling, and complete call tracking.

Version 1.0 | Project Concept and Sales Flow

1. Project Overview

This project is a complete calling software platform for companies that contact customers at scale. It combines auto dialing, personalized voice messages, incoming call handling, IVR menus, call recording, employee availability checking, and CRM tracking in one system.

The goal is simple: reduce manual calling work, increase customer connection rate, and make sure interested customers are quickly connected to a free executive.

Core Value

- Automatically call customers from uploaded lists.
- Play recorded or text-to-speech messages with variables such as customer name, company name, due amount, city, product, or appointment date.
- Transfer interested customers to available employees in real time.
- Handle incoming calls with the same IVR and routing process.
- Record calls, save outcomes, and show reports for management.

2. Main Users

User Role	What They Do
Admin / Company Owner	Creates campaigns, uploads customer data, monitors calls, checks reports, manages employees.
Manager	Assigns leads, monitors team performance, checks recordings and callback requests.
Customer Executive	Receives transferred calls, updates call result, adds notes, schedules callbacks.
Customer	Receives auto calls or calls company number and can connect to an executive.

3. Outbound Auto Calling Flow

This is the flow when the company wants the software to call customers automatically.

Example Message

Hello {{customer_name}}, we are calling from {{company_name}} regarding your {{service_name}}. Press 1 to speak with our executive, press 2 for callback, or press 9 to opt out.

4. Incoming Call Flow

The same system also handles calls when customers call the company number directly.

Step 1 - Customer Calls Company Number

Customer dials the business number published by the company.

Step 2 - Auto Answer and Greeting

System answers and plays Welcome message.

Step 3 - IVR Menu

Press 1 for sales, 2 for support, 3 for payment, 4 for callback.

Step 4 - Route by Department

System selects employee group based on selected option.

Step 5 - Availability Check

Free executive receives the call. Busy executives are skipped.

Step 6 - Queue, Voicemail, or Callback

If no one is free, customer can wait, leave message, or get callback.

This makes the product both an outbound auto dialer and an inbound IVR call center system.

5. Live Agent Transfer Logic

The most important feature is real-time transfer to the correct employee only when that employee is free.

Condition	System Action
Employee is online and free	Transfer customer call immediately.
Employee is online but busy	Skip that employee and check next available executive.
No employee is free	Play busy message and create callback lead.
Customer selects department	Route to employees assigned to that department.
Customer is high priority	Route to senior executive or priority queue.
Call is missed or failed	Mark status and schedule retry based on campaign rule.

Suggested Routing Methods

- Round-robin routing so calls are distributed fairly.
- Skill-based routing such as sales, support, renewal, recovery, or language.
- Priority routing for VIP customers or urgent campaigns.
- Fallback routing to callback queue when all employees are busy.

6. Feature Modules

Module	Features
CRM Contacts	Upload Excel/CSV, customer profile, tags, notes, call history, opt-out status.
Campaign Manager	Create campaign, select contact list, define schedule, message, retry rules.
Voice Message Builder	Recorded audio, text-to-speech, variable insertion, language selection.
Auto Dialer	Batch calling, call pacing, retry failed calls, time-window controls.
IVR System	Key press menu, incoming call greeting, department selection.
Agent Console	Receive transferred calls, see customer details, add call outcome, schedule callback.
Recording System	Record calls, store files, playback in CRM, download for compliance.
Reports Dashboard	Total calls, connected calls, transfers, callbacks, missed calls, executive performance.
Admin Settings	Users, roles, permissions, numbers, working hours, templates.

7. Technical Architecture

The platform can be built as a web-based CRM with telephony integration. Employees can use a browser dashboard, while calls are handled through VoIP/SIP, cloud telephony APIs, or an on-premise PBX depending on company requirement.

Layer	Recommended Components
Frontend	Web dashboard for admin, manager, and executives.
Backend API	User login, campaign engine, CRM data, call logs, routing logic.
Database	Customers, employees, call records, recordings, campaign configuration.
Telephony Layer	SIP/VoIP provider, PBX, or cloud calling API for outbound and inbound calls.
Voice Layer	Pre-recorded audio files and optional text-to-speech generation.
Storage	Secure storage for recordings and uploaded customer files.
Analytics	Campaign reports, employee performance, call outcomes, SLA tracking.

Integrations can include WhatsApp/SMS follow-ups, payment links, helpdesk software, ERP/CRM tools, and email notifications.

8. Sales Benefits for Companies

- Saves executive time by automating repeated calling work.
- Improves lead conversion because interested customers are transferred instantly.
- Reduces missed opportunities through callback queues and retry rules.
- Gives management full visibility with recordings, reports, and employee performance data.
- Creates a professional company calling experience for both incoming and outgoing calls.
- Supports scalable campaigns for sales, support, collection, reminders, renewals, appointments, and surveys.

Use Cases

Industry	Example Use
Education	Admission follow-up, fee reminder, inquiry handling.
Finance	Loan reminder, EMI follow-up, document pending calls.
Healthcare	Appointment reminders, patient follow-up, report availability.
Real Estate	Lead follow-up, site visit confirmation, project inquiry routing.
E-commerce	Order confirmation, delivery issue, feedback calls.
Service Companies	Renewal reminder, AMC follow-up, support call routing.

9. Suggested MVP Scope

For the first sellable version, the product should focus on essential features that demonstrate business value quickly.

Phase	Deliverables
MVP Phase 1	Admin login, customer upload, campaign creation, outbound auto call, fixed voice message, call logs.
MVP Phase 2	Variable message support, IVR key press, live agent transfer, employee availability.
MVP Phase 3	Incoming call handling, callback queue, recordings, reports dashboard.
Advanced Phase	AI voice, speech recognition, WhatsApp/SMS follow-up, payment integration, multi-branch support.

Important Business Rules

- Respect customer calling time windows and opt-out requests.
- Store recordings securely with role-based access.
- Keep retry limits to avoid customer irritation.
- Show clear status for every call: pending, ringing, connected, transferred, failed, callback, completed.

10. Demo Script for Selling

A strong sales demo should show the company exactly how the system saves time and captures interested customers.

- Upload a sample customer Excel file.
- Create a campaign with message variables.
- Start auto calling for a small batch.
- Show the customer hearing a personalized message.
- Press 1 as the customer to request an executive.
- Show the software checking free employees and transferring the call.
- Show executive screen with customer details and notes.
- End the call and show recording, status, and report update.
- Call the company number as an incoming customer and show the IVR process.

Final Positioning

This product can be sold as a smart calling CRM for companies that want automation plus human handoff. It is not only an auto dialer; it is a complete customer communication system for outbound campaigns, inbound calls, live transfer, recordings, and performance tracking.
